## **DETAILED ACTION**

## Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- Claims 1-8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Nakamura et 2. al (USPN 6,731,363.) Nakamura et al teach an anti-glare and anti-reflection film comprising a transparent substrate having on one side an anti-glare hardcoat layer with a thickness of 0.5 to 10 microns, formed from a resin cured by ionizing radiation and matt particles with an average particle size of 1.0 to 5.0 microns that may be selected from the group listed at Col. 7, lines 49-55, which includes silica particles and crosslinked polysiloxane particles, and are preferably transparent, wherein Nakamura et al further teach that two or more kinds of particulate material may be utilized as the matting particles and that finer particles may also be incorporated into the layer having a particle size of 0.1-1 microns to impart internal scattering property to the layer (Abstract; Col. 1, line 52-Col. 2, line 3; Col. 3, lines 1-19; Col. 6, lines 46-54; Col. 7, lines 11-67; Col. 8, lines 1-7); hence, one having ordinary skill in the art would have been motivated to utilize both silica particles and crosslinked polysiloxane particles in the anti-glare layer. With respect to particle size and amount of silica and/or polysiloxane particles, Nakamura et al do not specifically teach the average particle diameter ratio and weight parts of each as instant claimed. However, Nakamura et al do teach that the particles have a particle size that overlaps the instantly claimed range wherein silica and polysiloxane particles with an average particle size of

Application/Control Number: 10/628,926

Art Unit: 1773

1 micron, constituting the lower endpoint of the range taught by Nakamura, would read upon the instantly claimed average particle diameter values and ratio. Further, Nakamura et al teach that the particles are preferably transparent and that particle size and amount are result-effective variables affecting the matting/anti-glare and transparency properties of the layer. Hence, one having ordinary skill in the art at the time of the invention would have been motivated to include both silica and crosslinked polysiloxane particles in the anti-glare layer taught by Nakamura et al, utilizing routine experimentation to determine the optimum particle size and amount of each particulate material in order to provide the desired anti-glare and transparency properties for a particular end use. With respect to instant claim 2, though Nakamura et al teach that the fine particles may be crosslinked silicone resin particles, Nakamura et al do not teach polyorganosilsesquioxane particles however polyorganosilsesquioxane particulate is an obvious species of crosslinked silicon resin particulate and would have been obvious to one having ordinary skill in the art at the time of the invention.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Monique R Jackson whose telephone number is 571-272-1508. The examiner can normally be reached on Mondays-Thursdays, 8:00AM-4:30PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Deborah Jones can be reached on 571-272-1535. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
